

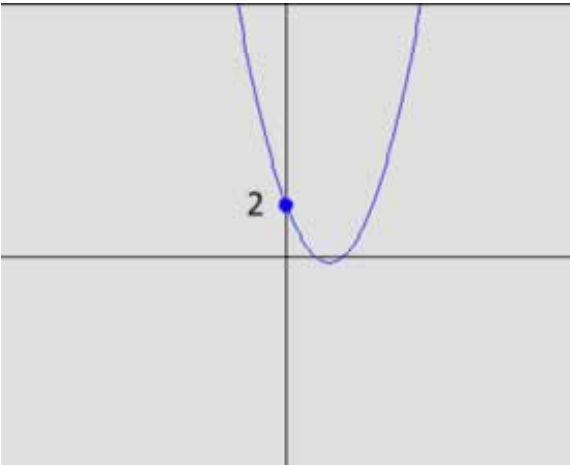

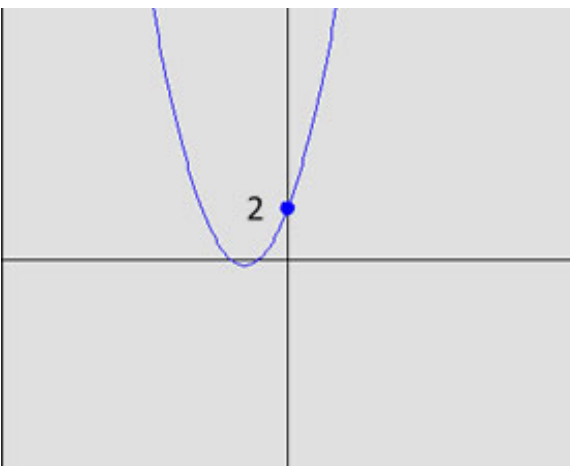

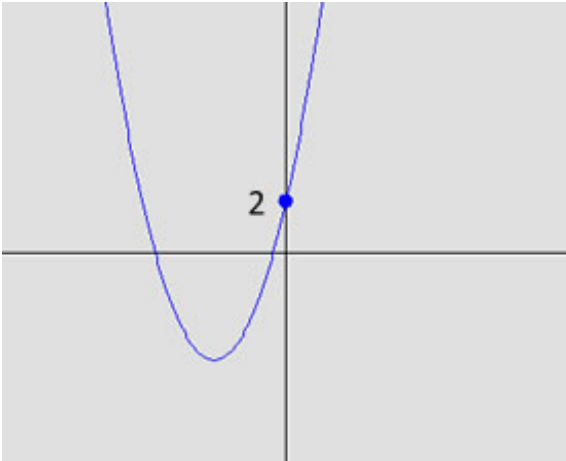

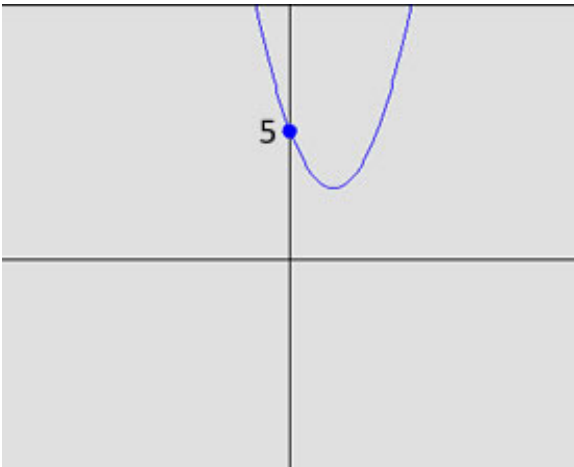

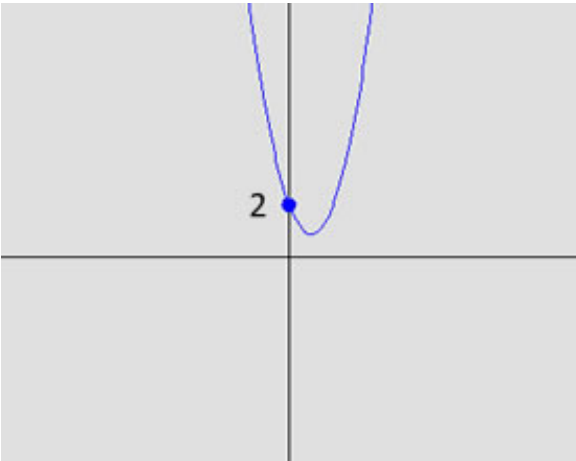

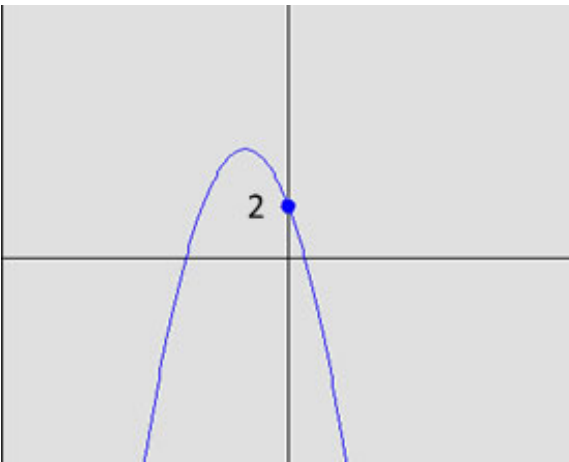

Graphing Changes in Variables in a Quadratic Equation

Using the expression, $x^2 - 3x + 2$, graph changes in the differences.

1. Graph $x^2 - 3x + 2$. Describe what you see.
2. Replace $+3x$ with $-3x$
3. Use $5x$ instead of $-3x$ (the graph will result in a non-solution because the line will not cross the x-axis).
4. Use $+5$ instead of $+2$
5. $2x^2$ is replaces x^2
6. Next, define what happens when the coefficient of x or x^2 has a negative and or positive value.

<p>1. Graph $x^2 - 3x + 2$. Describe what you see.</p> 	<p>The parabola's y intercept is at (0,2).</p>
<p>2. Next, graph the same equation, but replace $-3x$ with $+3x$</p> 	<p>When the equation reads as $x^2 + 3x + 2$, an inverse of the parabola appears.</p> <p>Referring to the quadratic format $y = ax^2 + bx + c$, if you change the value of b from negative to positive, the parabola is flipped horizontally.</p> <p>Compare the new image with the original above.</p>

<p>3. Use $5x$ instead of $-3x$ (the graph will result in a non-solution because the line will not cross the x-axis).</p> 	<p>$f(x) = x^2 + 5x + 2$</p> <p>The parabola becomes larger or longer when b is increased</p>
<p>4. Graph the equation, but use $+5$ instead of $+2$</p> 	<p>When $f(x) = x^2 - 3x + 5$</p> <p>The y intercept changes from 2 to 5.</p> <p>The y intercept coordinates are $(0, 5)$</p>

<p>5. Graph the equation, but replace x^2 with $2x^2$.</p> 	<p>When $f(x) = 2x^2 - 3x + 2$</p> <p>The width of the parabola decreases.</p>
<p>6. Finally, define what happens when the coefficient of x or x^2 has a negative and or positive value.</p> 	<p>$f(x) = -x^2 - 3x + 2$</p> <p>The parabola is flipped over vertically or opens downward.</p>
